

# Project Documentation

## Hotel Sales

### 1. Project Overview

**Restaurant Sales Analysis using Power BI** is a data visualization and business intelligence project designed to analyze restaurant sales performance and customer behavior. The project uses a restaurant sales dataset containing information such as transaction details, order type, menu items, categories, restaurant locations, customer ratings, quantity, and revenue.

### 2. Tools Used

- Microsoft Excel
- Power BI

### 3. Dataset

- Source: 04 Restaurant Sales
- Data contains: Transaction ID, Order Date, Restaurant Location, Order Type, Menu Item, Category, Quantity, Unit Price, Order Total, Customer Rating.

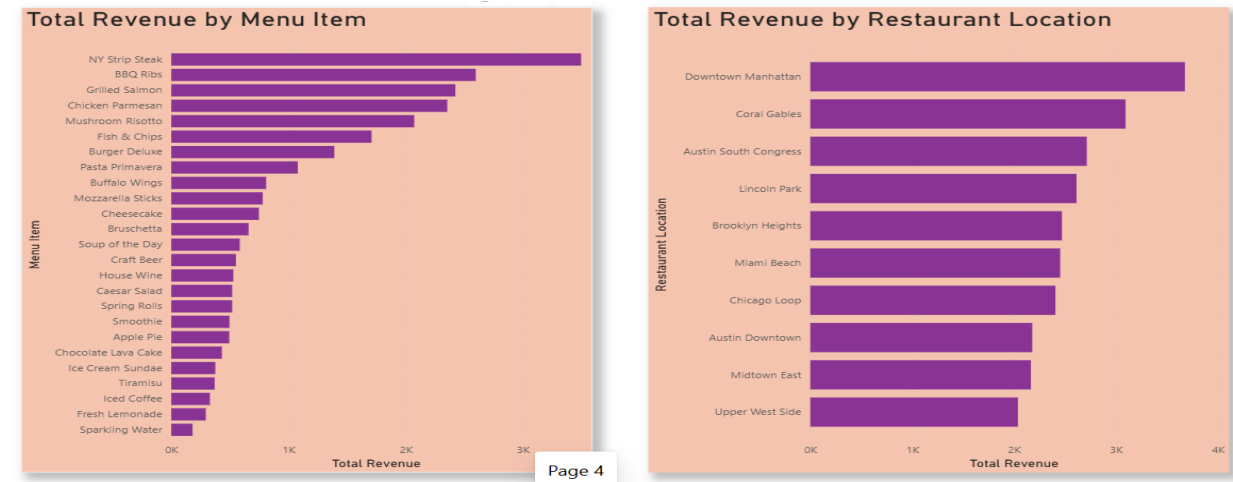

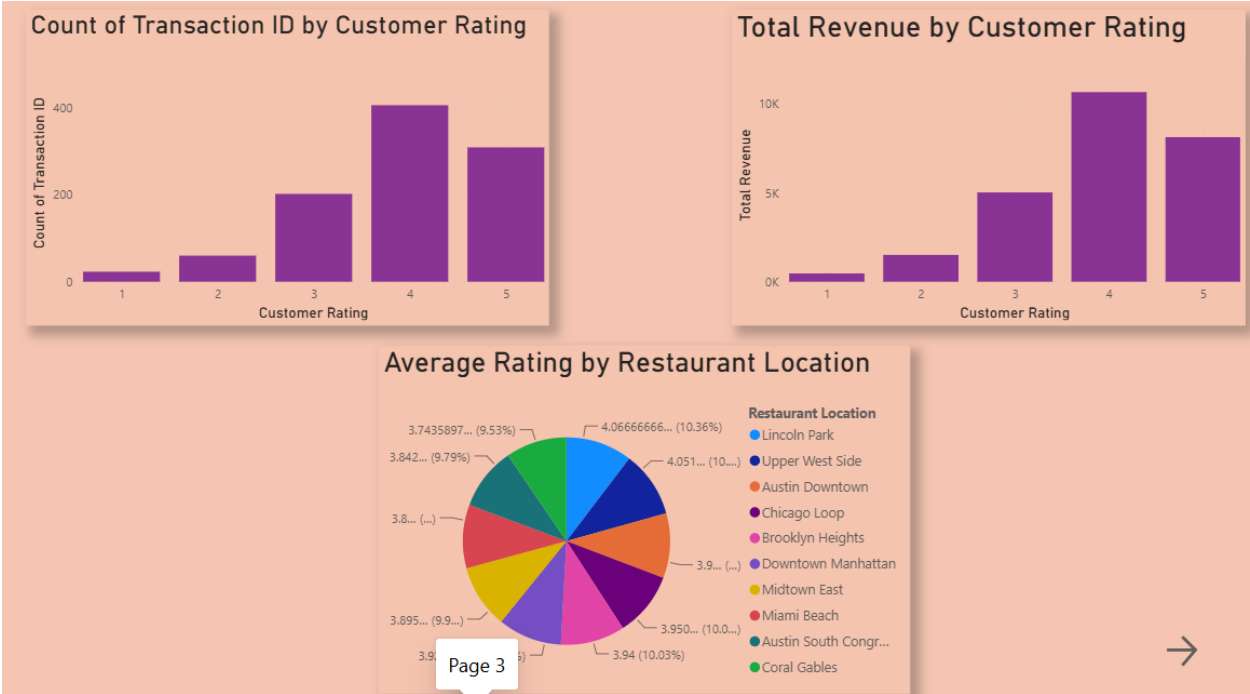

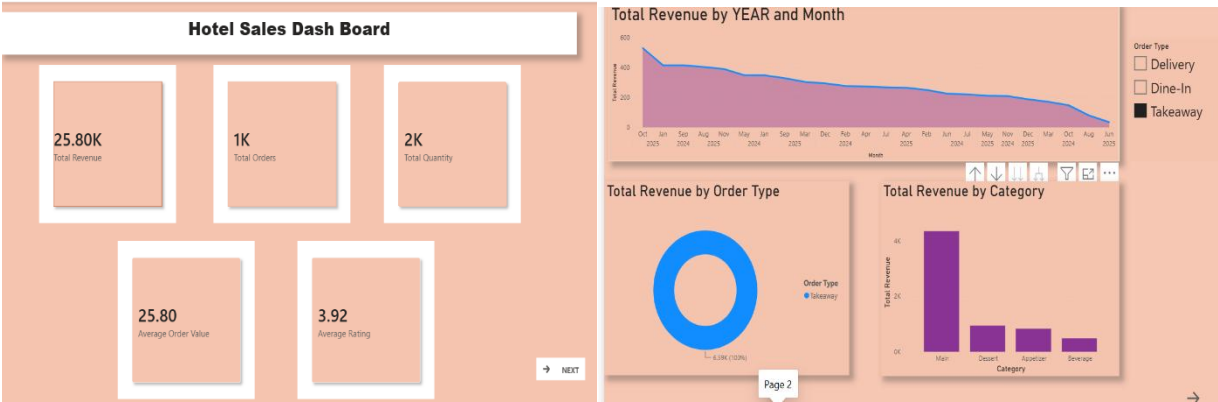

### 4. Steps Followed

- Cleaned data in Excel (e.g., removed blanks, formatted columns)
- Used Excel formulas for basic analysis
- Imported cleaned data into Power BI
- Built dashboards using charts, slicers, and cards

### 5. Key Insights

- Top Menu Item: NY Strip Steak is the highest revenue generator (Over 3K), followed by BBQ Ribs and Grilled Salmon. This is the star product.
- Lowest Performers: Sparkling Water, Fresh Lemonade, Iced Coffee generate less than 200 revenue.
- Top Location: Downtown Manhattan generates highest revenue (3.6K+), followed by Coral Gables (3K+). Upper West Side is lowest (2K).
